

Application Case Study

Coiled Metal Processing and Storage

Application: Coils must be handled without damaging the ID. The plastic ID rings are used to protect the edges of the coil ID's while the coils are shipped and handled during processing. Also pictured is a yellow industrial strength coil pad. The yellow pad protects the coils while they are stored by cushioning the pad against the floor. The ergonomic and safety benefits to the pads are realized when oil runoff from the coils is collected in a pan at the end of the pan. The pan is molded into the yellow pad.
